Emergency Department COVID-19 Management Tool

May 2022

This tool was developed to provide a pragmatic framework to assist with severity classification, risk assessment, diagnostic workup, disposition, and treatment of patients with suspected or confirmed SARS-CoV-2 (COVID-19) in the emergency department.

- It is designed to assist with the management of adult patients (>18 years old) with symptomatic infection.
- For information on pediatric MIS-C protocols (CHOP, Minnesota, and Yale) and suggestion against Monoclonal Antibodies.
- This tool is not intended to represent a legal standard of care for emergency physicians. Recommendations offered in this tool are not intended to represent the only diagnostic or management options available to the emergency physician. Individual physician's judgment and consideration of patient resources/preferences is essential.
- This tool is not exhaustive in regards to diagnostic and treatment recommendations. Patients may present with particular conditions (MI, PE, stroke) that could be manifestations of severe or critical COVID-19. These conditions may require additional specific diagnostic and therapeutic interventions not discussed in this tool.
- Evidence on this topic (including differences in severity that may occur with evolving variants) is changing quickly and may alter recommendations.

A digitized version of this tool can now be found at MDcalc.

**Step 1 - Severity Classification**
Assess the patient’s severity of disease utilizing NIH criteria.

<table>
<thead>
<tr>

</tbody>
</table>

**Step 2 - Risk Prognostication**

Patients with MILD and MODERATE Severity should be further assessed to determine their risk of disease progression.

The PRIEST Score is a validated tool to predict a patient’s risk for end organ failure and/or mortality using readily available data on initial presentation to the ED.

The ACP working group recognizes that there are other risk prognostication calculators that have been published. The PRIEST Score is included here as it offers a pragmatic approach with variables that don’t require diagnostic testing and don’t overlap with medical conditions that are within the separate risk assessment section.

<table>
<thead>
<tr>
<th>Variable</th>
<th>1 Point</th>

</tbody>
</table>

**Step 3 - Risk Assessment**

The CDC maintains a list of underlying medical conditions associated with higher risk of severe COVID-19. If your patient has one (or especially multiple) risk factors, you may want to consider in the approach taken in subsequent steps for diagnostic testing, disposition, and treatment.

**The CDC notes that patient race/ethnicity, socioeconomic status, and healthcare resources may effect clinical outcomes and advise consideration in clinical risk assessment.**

**Meta-analysis / Systematic reviews:**
- Bronchiectasis
- Bronchopulmonary dysplasia
- Pulmonary hypertension
- Pulmonary embolism
- Cancer
- Cerebrovascular disease
- Chronic kidney disease
- Chronic liver disease
- COPD
- Diabetes mellitus (type 1 and 2)
- Heart conditions*
- Intestinal lung disease
- Smoking (current and former)
- Tuberculosis
- Obesity
- Pregnancy (and recent pregnancy)
- Mental health disorders*

**Cohort / Case-control / Cross-sectional:**
- Children with certain underlying conditions
- Down syndrome
- HIV
- Neurologic conditions
- Overweight
- Sickle cell disease
- Solid organ or blood stem transplantation
- Substance use disorders
- Use of corticosteroids
- Immunosuppressive medications

**Case series / Case reports:**
- Cystic fibrosis
- Thalassemia

**Mixed Evidence:**
- Asthma
- Hypertension (possibly)
- Immune deficiencies
Step 4 - Diagnostic Testing

The following imaging and lab tests should be considered based on your patients severity and risk for disease progression.

<table>
<thead>
<tr>
<th>MILD</th>
<th>MODERATE</th>
<th>SEVERE</th>
<th>CRITICAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Based on clinician’s judgement, diagnostic testing may not be necessary in patients with (ALL):</td>
<td>Per the NIH...</td>
<td>Additional tests to consider include:</td>
<td></td>
</tr>
<tr>
<td>- Mild Severity</td>
<td>Imaging: the optimal imaging technique has not yet been defined for people with symptomatic COVID-19. Initial evaluation for these patients may include:</td>
<td>- ABG</td>
<td></td>
</tr>
<tr>
<td>- PRIEST score ≤4</td>
<td>- Chest X-ray</td>
<td>- Coagulation screen</td>
<td></td>
</tr>
<tr>
<td>- 1 or less Risk Factors</td>
<td>- Pulmonary Ultrasound</td>
<td>- Inflammatory markers (procalcitonin / c-reactive protein)</td>
<td></td>
</tr>
<tr>
<td>Exertional SpO2 may have limited ability to identify adverse outcomes in otherwise well-appearing patients:</td>
<td>- CT Chest (if indicated)</td>
<td>- Ferritin</td>
<td></td>
</tr>
<tr>
<td>- &lt;3% change in SpO2</td>
<td>ECG: should be performed if indicated</td>
<td>- LDH</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Labs:</td>
<td>- CK, CK-MB</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- CBC w/ differential</td>
<td>- Troponin</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- CMP</td>
<td>- Blood and sputum cultures</td>
<td></td>
</tr>
</tbody>
</table>

Step 5 - Diagnostic Interpretation

It is recommended that users of this tool consult the ACEP COVID-19 Field Guide section on Laboratory Abnormalities.

- Laboratory findings at hospital admission
- Laboratory abnormalities in severe disease
- Associated with severe or critical illness
- Associated with mortality
- Hypercoagulability and COVID-19

Step 6 - Disposition

The following represents a pragmatic approach for disposition of patients depending on their disease severity. Clinicians may want to consider a patient’s risk for progression of disease based on PRIEST Score, risk factors, imaging, and labs in their disposition decision. See Step 7 for treatment guidance.

<table>
<thead>
<tr>
<th>MILD</th>
<th>MODERATE</th>
<th>SEVERE</th>
<th>CRITICAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Discharge Home</td>
<td>Discharge Home, consider if ALL:</td>
<td>Admission Location:</td>
<td>Admission</td>

<td>- PRIEST Score ≤4</td>
<td>based on clinician’s judgement</td>
<td>ICU</td>
</tr>
<tr>
<td>CDC Patient Educational Materials</td>
<td>- 1 (or less) Risk Factors</td>
<td></td>
<td>Transfer</td>
</tr>
<tr>
<td>SAEM Patient Toolkit</td>
<td>- No concerning Imaging or Lab results</td>
<td></td>
<td>Consider transfer if your facility does not have the resources or capacity to care for a critically ill COVID patient.</td>
</tr>
<tr>
<td>Consider</td>
<td>- Capability and resources to care for self at home</td>
<td></td>
<td>Consider transfer to an ECMO facility for patients who may benefit from this after consultation with receiving facility.</td>
</tr>
<tr>
<td>Home pulse oximetry</td>
<td>- No other condition that warrants admission</td>
<td></td>
<td></td>
</tr>
<tr>
<td>In patients with PRIEST Score ≥5 and/or multiple Risk Factors</td>
<td>Admission, consider if ANY:</td>
<td>Admission Location:</td>
<td></td>
</tr>
<tr>
<td>Clinicians should consider early follow-up with primary care physician or other health system access points.</td>
<td>- PRIEST Score ≥5</td>
<td>based on clinician’s judgement</td>
<td>ICU</td>
</tr>
<tr>
<td>Patient should be educated on their increased risk for severe disease and precautions to return to the ED.</td>
<td>- Multiple Risk Factors</td>
<td></td>
<td>Transfer</td>
</tr>
<tr>
<td></td>
<td>- Concerning Imaging or Lab results</td>
<td></td>
<td>Consider transfer if your facility does not have the resources or capacity to care for a severe COVID patient that could deteriorate.</td>
</tr>
<tr>
<td></td>
<td>- Does NOT have the capability or resources to care for self at home</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Admission Location:</td>
<td>Based on clinician’s judgement</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Observation</td>
<td>Observation</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Inpatient Floor</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Intermediate</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>At times of surge and capacity constraints some patient who would normally be admitted to the hospital, may need to be sent home:32-34</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Supply patient with educational materials on precautions and items to be monitoring at home</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Follow-up visit arranged via PCP or tele-health</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Consider home pulse oximetry</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Consider home oxygen therapy</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Clinicians should coordinate with their hospital administration to identify times of capacity constraint (i.e. this should not be a decision that individual physicians need to make)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

AMA
- Patient wishes to leave Against Medical Advice (AMA) for admission to the hospital and/or additional therapeutic treatment.
Step 7a - Non-Pharmacologic Treatment

The following treatments should be considered based on the patient’s severity and risk of disease progression.

COVID-19 vaccination is recommended for everyone 5 years of age and older, regardless of a history of symptomatic or asymptomatic SARS-CoV-2 infection.

- People with known current SARS-CoV-2 infection should defer vaccination at least until recovery from the acute illness (if symptoms were present) has been achieved and criteria to discontinue isolation have been met.
- Current evidence about the optimal timing between SARS-CoV-2 infection and vaccination is insufficient to inform guidance.
- More information on vaccination can be found HERE and Vaccination FAQs.

Step 7b - Pharmacologic Treatment

The following medications should be considered for treatment based on the patient’s severity and risk of disease progression.

Pharmacologic recommendations for patients with COVID-19 are evolving quickly.

- For the latest updates and details visit the NIH or IDSA Guidelines.
- For the latest information on local availability of therapies for COVID, check your State Health Department.
- For tips and tricks on how to talk with patients about COVID treatment options see the SAEM Provider Toolkit.

<table>
<thead>
<tr>
<th>DISCHARGED FROM EMERGENCY DEPARTMENT</th>
<th>ADMITTED TO HOSPITAL</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Prefered Therapies:</strong> Use 1 of the following (listed in order of preference), see Footnote Section before prescribing.</td>
<td><strong>Hospitalized but does not require supplemental 02:</strong></td>
</tr>
<tr>
<td>1. Nirmatrelvir 300 mg with ritonavir 100 mg (Paxlovid) orally twice daily for 5 days, initiated as soon as possible and within 5 days of symptom onset in those aged ≥12 years and weighing ≥40 kg (AIIa).</td>
<td>Do not use dexamethasone (AIIa) or other corticosteroids (AII)</td>
</tr>
<tr>
<td>2. Remdesivir 200 mg IV on Day 1, followed by remdesivir 100 mg IV daily on Days 2 and 3, initiated as soon as possible and within 7 days of symptom onset in those aged ≥12 years and weighing ≥40 kg (BIIb).</td>
<td>For patients at high risk of disease progression: Remdesivir (BII)</td>
</tr>
<tr>
<td></td>
<td><strong>Hospitalized and requires supplemental 02:</strong></td>
</tr>
<tr>
<td></td>
<td>For pts only requiring minimal supplemental 02: Remdesivir (BIIa)</td>
</tr>
<tr>
<td></td>
<td>For most patients: Dexamethasone plus remdesivir (BIIa)</td>
</tr>
<tr>
<td></td>
<td>If remdesivir is not available: Dexamethasone (BIIa)</td>
</tr>
<tr>
<td></td>
<td>For patients on dexamethasone with rapidly increasing oxygen needs and systemic inflammation: Add baricitinib or tocilizumab to one of the above 3 options (BIIa)</td>
</tr>
<tr>
<td></td>
<td><strong>Hospitalized and requires mechanical ventilation or ECMO:</strong></td>
</tr>
<tr>
<td></td>
<td>Upon initiation of MV or ECMO, if not already initiated: One of the following: Dexamethasone plus baricitinib (AII) or dexamethasone plus tocilizumab (BIIa)</td>
</tr>
<tr>
<td></td>
<td>If neither baricitinib/tocilizumab nor tocilizumab/sarilumab can be procured: Dexamethasone (AII)</td>
</tr>
<tr>
<td></td>
<td>Optional: Add remdesivir to any 1 of the above selections (CIIa)</td>
</tr>
<tr>
<td></td>
<td><strong>Hospitalized and requires mechanical ventilation or ECMO:</strong></td>
</tr>
<tr>
<td></td>
<td>For mechanically ventilated adults with refractory hypoxemia despite optimized ventilation, consider prone ventilation for 12 to 16 hours per day over no prone ventilation</td>
</tr>
<tr>
<td></td>
<td>Consider using a conservative fluid strategy over a liberal fluid strategy (BII)</td>
</tr>
<tr>
<td></td>
<td>Insufficient Data to recommend for or against ECMO in these patients</td>
</tr>
<tr>
<td></td>
<td>Against the routine use of inhaled nitric oxide (AII)</td>
</tr>
</tbody>
</table>

**Steroids**
Dexamethasone (or other corticosteroids) should NOT be initiated in these patients in the absence of another indication. (AII)

Insufficient Evidence At this time there is insufficient data to recommend either for or against the following medications for SARS-CoV-2 (COVID-19):
- Budesonide
- Fluvoxamine
- Herbal medications
- IL-1 inhibitors

DO NOT USE - The following are recommended AGAINST for the treatment of SARS-CoV-2 (COVID-19) at the time of publication of this tool:
- Anti-interleukin-6 receptor monoclonal antibodies (except tocilizumab) or anti-IL-6 monoclonal antibody (siltuximab), except in a clinical trial (BII)
- Azithromycin alone (AII)
- Chloroquine or hydroxychloroquine with or without azithromycin (AII)
- Colchicine (InPt-Adj) (OutPt-BIIa)
- Famotidine, except in a clinical trial (AII)

**Intubation is recommended for severe respiratory failure:**
- Oxygenation goal for ventilated patients should be 92-96%
- Consider low tidal volume (VT) ventilation (VT 4–8 mL/kg of predicted body weight) over higher VT ventilation (VT >8 mL/kg (AII))
- Target plateau pressures of <30 cm H2O (BII)
- A higher positive end-expiratory pressure (PEEP) strategy is recommended over a lower PEEP strategy (BII)
- For mechanically ventilated adults with refractory hypoxemia despite optimized ventilation, consider prone ventilation for 12 to 16 hours per day over no prone ventilation

**Anticoagulation**
Unless contraindicated, anticoagulation is recommended for admitted COVID-19 patients. The recommendations and evidence for therapeutic vs. prophylactic anticoagulation are rapidly evolving. The latest information can be found at the NIH Anticoagulation Page.
The ACEP Emergency Department COVID-19 Management Tool was utilized to assist in the decision process on how to best manage this patient. This tool is a pragmatic approach to management of patient’s with suspected or confirmed SARS-CoV-2 in the emergency department. It is based on guidelines from the CDC, NIH, and additional published studies. COVID-19 is a novel pandemic and as such evidence is rapidly evolving on the best way to manage patients with this condition.

### SMART PHRASES

This page represents a list of phrases that clinicians may want to utilize within their EMR documentation. It is broken down based on the steps that are outlined on the prior pages of this tool. EMR and IT vendors may want to utilize these phrases, along with specific data that is selected by clinicians as they utilize electronic versions of this tool.

#### Step 1 - Severity

- **Severity Classification** was determined based on NIH criteria.
  - **MILD**: Based on the criteria present at the time of evaluation, the patient was determined to have MILD Severity.
  - **MODERATE**: Based on the criteria present at the time of evaluation, the patient was determined to have MODERATE Severity.
  - **SEVERE**: Based on the criteria present at the time of evaluation, the patient was determined to have SEVERE Severity.
  - **CRITICAL**: Based on the criteria present at the time of evaluation, the patient was determined to have CRITICAL Severity.

#### Step 2 - Risk Prognostication

- The PRIEST Score, a validated tool to determine the risk of mortality and/or end-organ failure, was utilized to assess the patient’s risk of disease progression.
  - Based on a PRIEST Score of _____ the patient is estimated to have a _____% risk.

#### Step 3 - Risk Assessment

- A Risk Assessment was performed that considers additional factors that have been shown in published studies to increase a patient’s risk for disease progression.
  - **0 Risk Factors**: Patient did not have any additional risk factors based on those included within this tool.
  - **1 Risk Factor**: Patient was noted to have an additional risk factor.
  - **2 (or more) Risk Factors**: Patient was noted to have 2 (or more) additional risk factors.

#### Step 4 - Diagnostic Testing

- Appropriate Diagnostic Testing was performed on the patient based on their severity and risk of disease progression.
  - **MILD... no additional testing obtained**: No diagnostic testing was obtained, because the patient was noted to have MILD severity, ≤4 on the PRIEST Score, and ≤1 additional risk factors.
  - **Exertional O2**: An O2 saturation was obtained after the patient exerted themselves for >1 minute. Their SpO2 stayed stable.
    - Negative
    - Positive: An O2 saturation was obtained after the patient exerted themselves for >1 minute. Their SpO2 dropped >3%.
  - **Imaging / Labs Obtained**: Appropriate imaging and labs were obtained in the emergency department based on clinical assessment of the patient.

#### Step 5 - Diagnostic Interpretation

- The Diagnostic Interpretation of imaging and labs that were obtained was as follows:
  - **NO Concerning Imaging/Labs**: There was no concern on imaging or labs.
  - **Concerning Imaging**: There was a concerning finding discovered on imaging that may prognosticate an increase in the patient’s risk of disease progression.
  - **Concerning Lab**: There was a concerning finding discovered on lab testing that may prognosticate an increase in the patient’s risk of disease progression.
  - **Multiple Concerning Imaging/ Labs**: There were multiple imaging and/or lab testing results that may prognosticate an increase in the patient’s risk of disease progression.
Emergency Department COVID-19 Management Tool

May 2022

SMART PHRASES (continued)

Step 6 - Disposition

<table>
<thead>
<tr>
<th>Severity</th>
<th>Discharge</th>
<th>PRIORITY</th>
<th>Risk Factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>MILD</td>
<td>Discharge</td>
<td>PRIEST ≤4 AND ≤1 Risk Factors</td>
<td>Patients with MILD Severity, a low PRIEST Score, and ≤1 risk factors are appropriate for Discharge Home.</td>
</tr>
<tr>
<td></td>
<td>Discharge</td>
<td>PRIEST &gt;5 OR ≥2 Risk Factors</td>
<td>Patients with MILD Severity who have an elevated PRIEST Score (≥5) and/or multiple risk factors, may still be discharged home. These patients should receive information on their elevated risk for Severe disease and should connect with early follow-up.</td>
</tr>
<tr>
<td>MODERATE</td>
<td>Admission</td>
<td>Patients with MODERATE Severity, a low PRIEST Score, and ≤1 risk factors may be Discharged Home based on an emergency physician’s clinical judgement.</td>
<td></td>
</tr>
<tr>
<td>SEVERE</td>
<td>Admission</td>
<td>Patients with SEVERE Severity meet criteria for admission to the hospital.</td>
<td></td>
</tr>
<tr>
<td>CRITICAL</td>
<td>Transfer</td>
<td>Patients with CRITICAL Severity meet criteria for admission to an ICU setting.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ECMO</td>
<td>Transfer should be considered if you are at a facility that does not have the ICU resources or capacity to care for a patient with CRITICAL Severity.</td>
<td></td>
</tr>
</tbody>
</table>

AMA

- The patient signed out Against Medical Advice, despite the offer of admission to the hospital and treatment due to the severity of their COVID manifestation. The patient is of normal mentation and has the capacity to make this decision, while understanding the consequences to their health.

Step 7a - Non-Pharmacologic Treatment

- The following Non-Pharmacologic Treatments were ordered on the patient, based on best practice guidelines at the time of publication of this tool.

<table>
<thead>
<tr>
<th>Severity</th>
<th>Treatment</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>MILD / MODERATE</td>
<td>Discharged Home</td>
<td>The patient was supplied with discharge instructions that includes activities (breathing exercises, balanced diet, etc.) they should consider at home.</td>
</tr>
<tr>
<td></td>
<td>Home O2</td>
<td>The patient was given a prescription for supplemental O2 at home.</td>
</tr>
<tr>
<td></td>
<td>Home Pulse Oximetry</td>
<td>The patient was given instructions for how to use a pulse oximeter at home to measure periodically their oxygen levels. They were given clear instructions on what measurements would warrant a return to the emergency department.</td>
</tr>
<tr>
<td></td>
<td>Vaccination</td>
<td>The patient was given information about the benefits of vaccination for COVID.</td>
</tr>
<tr>
<td>SEVERE</td>
<td>02 via NC</td>
<td>Supplemental oxygen was administered to the patient via nasal cannula. The patient was monitored for response to therapy.</td>
</tr>
<tr>
<td></td>
<td>HFNC</td>
<td>Additional oxygen was delivered via High-Flow Nasal Cannula (HFNC) per institutional protocol.</td>
</tr>
<tr>
<td></td>
<td>NIPPV</td>
<td>Additional oxygen was delivered via Non-Invasive Positive Pressure Ventilation (NIPPV) per institutional protocol.</td>
</tr>
<tr>
<td>CRITICAL</td>
<td>Intubation</td>
<td>The patient was intubated per institutional protocol.</td>
</tr>
<tr>
<td></td>
<td>Prone Ventilation</td>
<td>Due to the patient’s CRITICAL Severity and compromised respiratory status, they were intubated.</td>
</tr>
<tr>
<td></td>
<td>Conservative Fluids</td>
<td>Prone ventilation was utilized per institutional protocol.</td>
</tr>
</tbody>
</table>

Step 7b - Pharmacologic Treatment

- The following Pharmacologic Treatments were administered to the patient, based on NIH recommendations at the time of publication of this tool.

<table>
<thead>
<tr>

Emergency Department COVID-19 Management Tool

FOOTNOTES

Step 1 - Severity

- All severity classifications are outlined by the NIH. The NIH COVID-19 Treatment Guidelines Panel is a multi-disciplinary team of experts that meets routinely to discuss the impact of new evidence on best practices in addition to providing a standardized system for classifying clinical severity.4

Step 2 - Risk Prognostication

- The PRIEST Score is a validated tool to predict a patient’s risk for end organ failure and/or mortality.14,25
- The PRIEST Score can be accessed on MDCalc.

Step 3 - Risk Assessment

The CDC maintains a reference for medical conditions associated with high risk for severe COVID-19.

Race/Ethnicity and access to healthcare: the CDC has more information on how race, ethnicity, and access to health care resources may affect outcomes.

Economic Disparity: has been shown to be an independent variable of risk11

Pregnancy: has been shown to have increased hospitalization (OR 3.5).7
- Severe cases have been shown to have pre-term labor 45.4% compared to 6.9% of mild and recovered cases.9
- ACOG has published a guideline to assist with risk stratification of pregnant patients

Step 4 - Diagnostic Testing

- Exertional SpO2: post-exertional SpO2 may provide modest prognostic information of adverse outcome at 30 days.5,12,13
- Optimal time interval is not established.
- Some have suggested 1-2 minutes and a sit-stand option in the patient’s room (due to COVID restrictions)5
- A 3% drop has been used in several studies.21
- Another study used a quick walk test of 6 minutes. Decrease in ≥3% or ≥5% (conservative cutoff or postexercise ≤90% suggest poor outcome (need for mechanical ventilation) with LR+=3.5 and LR-=0.22.21

Diagnostic Testing: ACEP maintains a section on Laboratory Abnormalities in the COVID-19 Field Guide.

Step 5 - Diagnostic Interpretation

Imaging Interpretation

- Pulmonary US (POCUS) is appropriate as a COVID rule-in test (with diagnostic accuracy similar to CT) but should not be used for risk classification.24
- Models to prognostic risk based on CXR - results have been published.

Lab Interpretation

- Reference the ACEP COVID-19 Field Guide section on Laboratory Abnormalities for a review of common lab results at hospital admission, lab findings associated with severe disease, and those associated with mortality.

Step 6 - Disposition

Discharge of select COVID patients with Home Oxygen has been shown to be associated with low rates of mortality and return admission.22,23,24

The CDC maintains Patient Educational Materials, SAEM Patient Toolkit has materials for patients to understand more about COVID.

Step 7a - Non-Pharmacologic Treatment

Home Supplemental O2

Discharge of select COVID patients with Home Oxygen has been shown to be associated with low rates of mortality and return admission.22,23,24

Studies in COVID and other viral illnesses have shown the benefit of:

- Rest 10
- Healthy diet 17
- Adequate sleep 16
- Exercise 18

Issues with SpO2 measurements

- If sending patients home with instructions for pulse oximetry, be mindful that SpO2 readings should always be considered an estimate of oxygen saturation. The FDA has just issued precautions on SpO2 devices.26
- If an FDA-cleared pulse oximeter reads 90%, then the true oxygen saturation in the blood is generally between 86-94%. Pulse oximeter accuracy is highest at saturations of 90-100%, intermediate at 80-90%, and lowest below 80%.
- Additionally, SpO2 measurements have been shown not to be as reliable in patients with pigmentation of their skin.25

Vaccination

- Additional information on current vaccinations recommendations, can be found HERE and on Vaccination FAQs
- SMART Phrases from ACEP for patients can be found HERE

Step 7b - Pharmacologic Treatment

Medications - recommendations are maintained by the NIH and FDA.

Recommendations for the treatment of patients discharged home, but who have a HIGH risk for disease progression is evolving quickly due to the Omicron Variant of Concern (VOC).

Guidance can be found on the NIH Outpatient Treatment Page

- Paxlovid EUA Fact Sheet: www.fda.gov/media/155050/download
- Bebtelovimab EUA Factsheet: www.fda.gov/media/156152/download
- Molnupiravir EUA Fact Sheet: www.fda.gov/media/155054/download
- The SAEM Provider Toolkit offers tips and tricks on how to communicate with patients about COVID treatment options.

No longer authorized by the FDA due to high prevalence of BA.2 variant

- Sotrovimab EUA Fact Sheet: www.fda.gov/media/149534/download

CAUTION with prescribing Paxlovid

- Ritonavir-boosted nirmatrelvir (Paxlovid) has significant and complex drug-drug interactions, primarily due to the ritonavir component of the combination. Before prescribing, clinicians should carefully review the patient’s concomitant medications, including over-the-counter medications and herbal supplements, to evaluate potential drug-drug interactions.

- Clinicians who are not experienced in prescribing ritonavir-boosted drugs should refer to resources such as the NIH Paxlovid Drug-Drug Interactions page, the Ontario COVID-19 Science Advisory Table, the EUA fact sheet for ritonavir-boosted nirmatrelvir (Paxlovid) or the Liverpool COVID-19 Drug Interactions website for additional guidance.

- Consultation with an expert (e.g., clinical pharmacist, HIV specialist, and/or the patient’s specialist provider[s], if applicable) should also be considered.

NIH Rating of Recommendations

- A = Strong
- B = Moderate
- C = Weak

Rating of Evidence

- I = One or more randomized trials without major limitations
- IIa = Other randomized trials or subgroup analyses of randomized trials
- IIb = Nonrandomized trials or observational cohort studies
- III = expert opinion
