Overtesting

- About 15% of all ED patients receive a CT scan
- Overtesting is an “assurance behavior” to achieve perception of normative practice Studdert DM et al, JAMA, 2005, 293:2609; Lucas F.L. Circ Cardiov Qual Outcomes, 2010; 3:253
Empathy

• Many academic definitions, but I argue that empathy is trait unique to each person

• “You never really know a man until you understand things from his point of view, until you climb into his skin and walk around in it.” Lee, Harper. To Kill a Mockingbird. J.B. Lippincott & Co., 1960

• Empathy is yours, not an administrators’ or researchers’ thing
People with PE

People tested for PE
Empathy

• Empathy may be an antidote to burnout Lamothe M, et al. Outcomes of MBSR or MBSR-based interventions in health care providers: A systematic review with a focus on empathy and emotional competencies. Complement Ther Med. 201; 24:19-28
Overarching Hypothesis

A strategy that increases the perception of empathy in the patient and the provider can decrease unnecessary diagnostic testing
Empathy and Reassurance

• Reassurance has several dimensions.
  – Affective: empathy, emotional, “human connection”
  – Cognitive: explanations, mechanisms facts and numbers

• Does affective improve cognitive?

The study

- **Seven sites** (Charlotte NC, Jackson MS, Indianapolis IN, New York NY, Roanoke VA, San Francisco CA, Rochester MN)
- Adult patients undergoing CT abdomen, chest or head
- Physician agrees the CT is unlikely to show an emergent condition & CT is negative
- Patients approached near the end of care

“I have carefully considered what you told me about what brought you here today”

“I have thought about your past medical problems and what they mean today”

“The CT scan has a lot of radiation which may increase risk of cancer later in life”

“The CT scan requires contrast to be injected in your blood, which may put stress on your kidneys”

“I have thought about the cost of your medical care to you today”

“I have thought about your vital signs and your physical examination”
“I have thought about what your [family member] said about your problem.”

“I have thought about how uncomfortable you look today”

“I have considered what your facial expressions have told me about how you feel”

“I have thought about what your body language has told me about how you feel today”

“I have thought about what prior research tells me about your condition today”

What other issue would you want your doctor to discuss with you about your condition? Are there any other ways to say any of the above statements that would make you feel better?
Theoretical construct of content

• Whole person approach
  – I have thought about you
• Medical competency
  – Present and past medical history
• JPPPSE components
  – Family and daily life
• Medical risk and error
  – Radiation and contrast

• Compassion
  – Pain and appearance
• Cognitive reassurance
  – Vital signs
  – Prior research
  – Cost of care
• Individual preferences
  – Verbatim response
Figure 1. The emergency diagnostic imaging care coordination cycle: a conceptual model. Modified from Comfere et al.¹
<table>
<thead>
<tr>
<th>Trust in physicians scale</th>
</tr>
</thead>
<tbody>
<tr>
<td>* Seven-point response scale: 1 strongly disagree; 2 disagree; 3 slightly disagree; 4 neutral; 5 slightly agree; 6 agree; 7 strongly agree.</td>
</tr>
<tr>
<td>1. I doubt that my doctor really cares about me as a person.</td>
</tr>
<tr>
<td>2. My doctor is usually considerate of my needs and puts them first.</td>
</tr>
<tr>
<td>3. I trust my doctor so much that I always try to follow his/her advice.</td>
</tr>
<tr>
<td>4. If my doctor tells me something is so, then it must be true.</td>
</tr>
<tr>
<td>5. I sometimes distrust my doctor's opinion and would like a second one.</td>

<tr>
<td>11. I sometimes worry that my doctor may not keep the information we discuss private.</td>
</tr>
<tr>
<td>12. I can overcome most illness without help from a medically trained professional.</td>
</tr>
<tr>
<td>13. Home remedies are often better than drugs prescribed by a doctor.</td>
</tr>
<tr>
<td>14. If I get sick, it is my own behavior that determines how soon I get well again.</td>
</tr>
<tr>
<td>15. I understand my health better than most doctors do.</td>
</tr>
</tbody>
</table>
Jefferson Scale of Patient Perceptions of Physician Empathy

Instructions: We would like to know the extent of your agreement or disagreement with each of the following statements about your physician named below. Please use the following 7-point scale and write your rating number from 1 to 7 on the underlined space before each statement (1 means that you Strongly Disagree, and 7 means you Strongly Agree with the statement, a higher number indicates more agreement).

1-------2-------3-------4-------5-------6-------7
Strongly Disagree

Strongly Agree

Dr. (Name of the physician in here)____________________

1. ___ Can view things from my perspective (see things as I see them).
2. ___ Asks about what is happening in my daily life.
3. ___ Seems concerned about me and my family
4. ___ Understands my emotions, feelings and concerns.
5. ___ Is an understanding doctor.

.
Results

• 219 patients were enrolled
• 49±17 years, 46% Caucasian
Results: Best to worst

• BEST: Attention to “overall condition” (71%), “medical history” (66%), and “vital signs and physical examination” (63%)
• GOOD: “radiation and cancer risk” (58%) and “stress on your kidneys from dye” (59%)
• OK: “Facial expressions” (48%) and “body language” (53%).
• WORST: “what your family members said” (46%) and “cost of your medical care to you” (42%).
"I have carefully considered what you told me about what brought you here today"
"I have thought about the cost of your medical care to you today"
Written comments

• ‘I need them to recognize my pain’
• ‘Looking at my history helps build trust. Letting me know tells me that you care about me and want to get the full picture’
• 'Tell me as much information as you have and break it down for me'
• ‘Go over what they are looking for with the CT. Go over plan of care and expected outcomes’
What did they think of us?

JPPPSE % strongest agreement

• My physician:
  – “can view things from my perspective” (58%)
  – “seems concerned about me and my family” (61%)
  – “understands my emotions feelings and concerns” (61%)
  – “is an understanding doctor” (76%),
  – “asks what is happening in my daily life” (47%)
• No differences by sex (p=0.54) or race (p=0.71).
• Regional differences in “seems concerned about me and my family” (p=0.04) and “understands my emotions feelings and concerns” (p=0.01).
“My physician can view things from my perspective (see things as I see them)”
“My physician can view things from my perspective (see things as I see them)”

15% failed to agree
“My physician is an understanding doctor”
Trust in Physicians scale

% with strongest response

• BEST: “I trust my doctor's judgement about my medical care” (47%)

• MID: “My doctor is a real expert in taking care of medical problems like mine” (40%)
“I sometimes distrust my doctor's opinion and would like a second one”
“I sometimes distrust my doctor's opinion and would like a second one”
“I understand my health better than most doctors do”
Summary

• Others have found increased empathy generally has positive effects
• We found simple phrases were well regarded
  – “I want to see this from your perspective”
  – “I have thought carefully about everything you have told me”
• About 15% indicate trust, but still want a second opinion
Next steps

• Patient panel + physicians to build the components of a “script” or “narrative” and help inform study outcomes
• Pilot test in 30 patients
• Apply for PCORI funding with provisional plan to use a multicenter, stepped wedge design to compare against AIDET
Study group
PAMA and the Emergency Physician

or: How I Learned to Stop Worrying and Love Decision Support

Jeremiah Schuur, MD, MHS
Brigham and Women’s Hospital
Harvard Medical School
Boston, MA
Funding & Disclosures

Investigator-initiated funding sources:
- Center for Medicare and Medicaid Innovation: ACEP TCPI SAN:
  - goal to reduce imaging for Renal colic, low back pain, CTPE, head CT
- AHRQ: Reducing radiation exposure in renal colic
- Emergency Medicine Foundation: alternate payment models
- CRICO: Improving safety with use of EHR

Other funding:
- Associate Medical Director CRICO (Risk Management)
- Medical-legal review
Agenda

• Review motivation for policy to reduce imaging and improve appropriateness

• Explain PAMA’s imaging provisions

• Review the evidence for & against clinical decision support (CDS)

• Review how PAMA will affect the Emergency Physician
Why do policymakers care about imaging use?

- Cost

2005 MedPAC

Fig. 1. Imaging Shows Highest Cumulative Growth in Services per Beneficiary (1999–2003)

Note—Includes all services in physician fee schedule.
Source—MedPAC analysis of Medicare claims data.
Why do policymakers care about imaging use?

- Cost → Waste (low-value care)
What tools do policymakers have to reduce imaging costs?

- Reduce payment per procedure
  - MedPAC has done this
  - Unpopular

- Encourage clinicians to reduce utilization
  - Quality measures

- Increase use of clinical evidence

## Five Things Physicians and Patients Should Question

1. **Avoid computed tomography (CT) scans of the head in emergency department patients with minor head injury who are at low risk based on validated decision rules.**

   Minor head injury is a common reason for visiting an emergency department. The majority of minor head injuries do not lead to injuries such as skull fractures or bleeding in the brain that need to be diagnosed by a CT scan. As CT scans expose patients to ionizing radiation, increasing patients’ lifetime risk of cancer, they should only be performed on patients at risk for significant injuries. Physicians can safely identify patients with minor head injury in whom it is safe to not perform an immediate head CT by performing a thorough history and physical examination following evidence-based guidelines. This approach has been proven safe and effective at reducing the use of CT scans in large clinical trials. In children, clinical observation in the emergency department is recommended for some patients with minor head injury prior to deciding whether to perform a CT scan.

2. **Avoid placing indwelling urinary catheters in the emergency department for either urine output monitoring in stable patients who can void, or for patient or staff convenience.**

   Indwelling urinary catheters are placed in patients in the emergency department to assist when patients cannot urinate, to monitor urine output or for patient comfort. Catheter-associated urinary tract infection (CAUTI) is the most common hospital-acquired infection in the U.S. and can be prevented by reducing the use of indwelling urinary catheters. Emergency physicians and nurses should discuss the need for a urinary catheter with a patient and their caregivers, as sometimes such catheters can be avoided. Emergency physicians can reduce the use of indwelling urinary catheters by following the Centers for Disease Control and Prevention’s evidence-based guidelines for the use of urinary catheters. Indications for a catheter may include output monitoring for critically ill patients, relief of urinary obstruction, at the time of surgery and end-of-life care. When possible, alternatives to indwelling urinary catheters should be used.

3. **Don’t delay engaging available palliative and hospice care services in the emergency department for patients likely to benefit.**

   Palliative care is medical care that provides comfort and relief of symptoms for patients who have chronic and/or incurable diseases. Hospice care is palliative care for those patients in the final few months of life. Emergency physicians should engage patients who present to the emergency department with chronic or terminal illnesses, and their families, in conversations about palliative care and hospice services. Earlier referral from the emergency department to hospice and palliative care services can benefit select patients resulting in both improved quality and quantity of life.

4. **Avoid antibiotics and wound cultures in emergency department patients with uncomplicated skin and soft tissue abscesses after successful incision and drainage and with adequate medical follow-up.**

   Skin and soft tissue infections are a frequent reason for visiting an emergency department. Some infections, called abscesses, become walled off and form pus under the skin. Opening and draining an abscess is the appropriate treatment; antibiotics offer no benefit. Even in abscesses caused by methicillin-resistant Staphylococcus aureus (MRSA), appropriately selected antibiotics offer no benefit if the abscess has been adequately drained and the patient has a well-functioning immune system. Additionally, culture of the drainage is not needed as the result will not routinely change treatment.

5. **Avoid instituting intravenous (IV) fluids before doing a trial of oral rehydration therapy in uncomplicated emergency department cases of mild to moderate dehydration in children.**

   Many children who come to the emergency department with dehydration require fluid replacement. To avoid the pain and potential complications of an IV catheter, it is preferable to give these fluids by mouth. Giving a medication for nausea may allow patients with nausea and vomiting to accept fluid replacement orally. This strategy can eliminate the need for an IV. It is best to give these medications early during the ED visit, rather than later, in order to allow time for them to work optimally.
Does Clinical Decision Support Reduce Unwarranted Variation in Yield of CT Pulmonary Angiogram?

Luciano M. Prevedello, MD, MPH, a,b,c,d,e Ali S. Raja, MD, MBA, MPH, a,c,e Ivan K. Ip, MD, MPH, a,b,c,e

Effect of Evidence-based Clinical Decision Support on the Use and Yield of CT Pulmonary Angiographic Imaging in Hospitalized Patients

1
Effect of Computerized Clinical Decision Support on the Use and Yield of CT Pulmonary Angiography in the Emergency Department

Figure 3: Graph shows CT pulmonary angiography (CTPA) use and yield before and after CDS implementation. CY = calendar year, Q1 = first quarter, Q2 = second quarter, Q3 = third quarter, Q4 = fourth quarter.
Medicare Imaging Demonstration Project

• **Who**: 5 institutions chosen as “conveners“, 4,000 providers
  • National Imaging Associates, Brigham and Women’s, Henry Ford Health System, University of Wisconsin, and Maine Medical Center.

• **What**: CDS & feedback
  • Providers used CDS software for 2 years, for 11 specific advanced imaging procedures within 3 modalities, for Medicare FFS beneficiaries.
  • Baseline Phase (6 months): providers used CDS to order exams, no feedback.
  • Intervention Phase (18 months): CDS delivered real-time feedback about adherence to appropriate use criteria.
MIDS Evaluation: Conclusion

“In summary, we found no evidence that the intervention led to anything beyond a small reduction—if any reduction at all—in advanced imaging volume. Furthermore, since more than half of the ordered advanced images did not link with guidelines, in these instances, appropriateness feedback was not available to share with ordering clinicians.”

-Medicare Imaging Demonstration Evaluation Report for the Report to Congress, RAND Health

Rating of Orders for Appropriateness

• Many imaging studies weren't rated for appropriateness, and this did not improve in all sites
  • varied by site from 20% reduction to 25% increase

Table 3.2. Calculated Probability of Rated Images for the Typical Provider, Averaged Across Specialty, in the Baseline and the Intervention Periods and the Change Between These Probabilities, by Convener

<table>

</tr>
</tbody>
</table>

Advisory Board Review of MID

• 3 major flaws
  • Limited, static guidelines
    • The appropriate use criteria imbedded into decision support during the demonstration were taken directly from national medical specialty societies with no option to modify criteria or add local guidelines.
  • Poor software integration
  • Unreliable appropriateness scoring
    • For the demonstration, each imaging order was designated into one of four categories: appropriate, inappropriate, uncertain, and not covered by guidelines.
    • more than 60% of orders fell into the unrated category.

• “Bottom line: let the MID act as guidance for how not to implement CDS, rather than proof CDS will not work.”

Protecting Access to Medicare Act of 2014 (PAMA)

• Assumptions:
  • There is wasteful low-value imaging
  • Clinicians are not familiar with or applying the evidence for imaging appropriateness
  • Appropriate use criteria (AUC) can help clinicians apply evidence and reduce low-value imaging
  • Radiologists are important gatekeepers in the imaging ordering process and should be incentivized to have ordering providers use AUC
PAMA

Figure 1: Use of Clinical Decision Support Mechanisms (CDSM) and Payment of Claims under the Medicare Imaging Appropriate Use Criteria (AUC) Program

- Ordering provider consults with AUC
  - Enters patient information into CDSM
  - Receives feedback on the appropriateness of the imaging service
  - Determines final imaging order

- Furnishing provider confirms AUC consultation
  - Reviews imaging order, patient data, and information on appropriateness
    - Furnishing provider may contact ordering provider to discuss order
  - Furnishes service to patient
  - Submits claim to CMS indicating which CDSM was used, the extent to which the order was rated as appropriate, and the ordering provider identification number

- CMS processes claim for Medicare payment
  - CMS processes and pays the furnishing provider's claim
  - Tracks the appropriateness of orders

PAMA

• Requires CMS to provide implementation details around 4 key components of the program:

• **Approval process for AUC**: The clinical guidelines that providers consult to comply with the mandate

• **Approval process for CDS mechanisms**: The electronic tools that allow providers to consult AUC during ordering

• **Provider requirements**: How ordering providers will demonstrate that they consulted AUC through an approved mechanism, how furnishing providers will submit that information to CMS, and how CMS will penalize those providers who do not comply

• **Identification of outlier providers**: How CMS will identify up to 5% of ordering providers as outliers and require them to obtain preauthorization when ordering imaging for Medicare patients
PAMA: Who decides what’s appropriate?

• Qualified provider-led entities

<table>

PAMA: Highlights

• Ordering providers must consult CDS for all outpatient advanced imaging exams → radiologists’ reimbursement depends on documenting ordering providers’ use
  • Claims must include
    1. CDS mechanism consulted
    2. Whether the order adherence to AUC, does not adhere to AUC, or no criterion are applicable
    3. NPI

• Outlier status for ordering providers will be determined by adherence to eight priority clinical areas

-- Finalized Priority Clinical Areas

1. Coronary artery disease*
2. Suspected pulmonary embolism*
3. Headache
4. Hip pain*
5. Low back pain
6. Shoulder pain*
7. Cancer of the lung
8. Cervical or neck pain

*Priority clinical areas not included in proposed rule

PAMA: Timeline

April 2014
PAMA¹ signed into law, requiring provider use of AUC via CDS for advanced imaging

November 2015
MPFS² CY 2016 final rule established appropriate use criteria approval process

November 2016
MPFS CY 2017 final rule established CDS mechanism requirements and approval process, clinical priority areas

January 1, 2018
Ordering providers must consult AUC through qualified CDS; to receive payment, furnishing must submit claims-based documentation

January 1, 2020
Ordering providers identified as outliers, may be required to obtain preauthorization

Does PAMA cover EM? CMS vs. ACEP

CMS
• PAMA requires CDS of all hospital based providers
• PAMA exempts emergency medical conditions
• Not all ED visits are EMCs
• So PAMA should apply to all ED visits except conditions clearly exempted, e.g. unstable trauma

ACEP
• PAMA exempts emergency medical conditions
• Radiology is used to determine if a patient has an EMC
• So CDS shouldn’t be required in ED visits

2016 Final Rule: Emergency Medical Conditions are exempt— but not all ED visits are EMCs
Summary

• Clinical decision support is an effective tool to increase imaging appropriateness, reduce utilization, and reduce variation*
  • Context specific design: applicable evidence & workflow
  • Local champions

• PAMA requires CDS for high cost radiology ordering
  • EDs will be pulled in by hospital HER

• It is unclear how exactly this will affect you…
  • Worst case: more useless clicking before ordering radiology tests
  • Best case: targeted evidence based decision support that supports best practice

• What should you do?
  • Have EM representation on hospital CDS / HER group
  • Advocate for context specific CDS and feedback
Questions?

@JSchuurMD
Does PAMA cover EM?
2016 Final Rule → YES

- f. Exceptions to Consulting and Reporting Requirements
  Section 1834(q)(4)(C) of the Act provides for certain exceptions to the AUC consultation and reporting requirements under section 1834(q)(4)(B) of the Act. First, the statute provides for an exception under section 1834(q)(4)(C)(i) of the Act where an applicable imaging service is ordered for an individual with an emergency medical condition as defined in section 1867(e)(1) of the Act. We believe this exception is warranted because there can be situations in which a delay in action would jeopardize the health or safety of individuals. Though we believe they occur primarily in the emergency department, these emergent situations could potentially arise in other settings. Furthermore, we recognize that most encounters in an emergency department are not for an emergency medical condition as defined in section 1867(e)(1) of the Act. We proposed to provide for an exception to the AUC consultation and reporting requirements under §414.94(i)(1) for an applicable imaging service ordered for an individual with an emergency medical condition as defined in section 1867(e)(1) of the Act. For example, if a patient, originally determined by the clinician to have an emergency medical condition prior to ordering an applicable imaging service, is later determined not to have had an emergency medical condition at that time, the relevant claims for applicable imaging services would still qualify for an exception. To meet the exception for an emergency medical condition as defined in section 1867(e)(1) of the Act, the clinician only needs to determine that the medical condition manifests itself by CMS-1654-F 874 acute symptoms of sufficient severity (including severe pain) such that the absence of immediate medical attention could reasonably be expected to result in: placing the health of the individual (or a woman’s unborn child) in serious jeopardy; serious impairment to bodily functions; or serious dysfunction of any bodily organ or part. Orders for advanced imaging services for beneficiaries with an emergency medical condition as defined under section 1867(e)(1) of the Act are excepted from the requirement to consult AUC. We intend through the CY 2018 PFS proposed rule to propose more details around how this exception will be identified on the Medicare claim.
Avoidable Imaging Wave II
E-QUAL and MIPS Credit

E-QUAL is considered a high value activity for CPIA.
Avoidable Imaging Wave II

Launching March 2017

- **Recruitment & Enrollment**
  - Readiness Assessment Survey
  - Submit provider NPIs & group tax ID number

- **Learning Period (6-9 months)**
  - Monthly Webinars
  - Podcasts
  - Publicize guidelines and materials
  - Benchmarking data
  - Office Hours

- **Wrap Up**
  - Data Reports
  - Summary Report
  - Lessons Learned
  - **Earn “High” weight Clinical Practice Improvement Activity credit for CMS MIPS program**
  - eCEM & MOC credit
  - Meet CMS PQRS requirements (CEDR)
  - Re-enrollment

*Time Commitment 1.5 hours per month*
What do I need to do NOW?

• **Required**: Complete E-QUAL Quality Improvement Readiness Assessment Survey - 10 minutes

• **Required**: Submit provider NPIs and group Tax ID Number (TIN) to ensure registration in TCPI program with CMS

Deadline to enroll into the Avoidable Imaging Wave II
February 22\textsuperscript{nd}
